RENTAL OF TEMPERATURE CONTROL

The environmental surcharges will ensure we can meet rising regulatory, sustainability and F-Gas obligations. These costs help cover essential depot servicing before equipment is dispatched, including the replacement of outdated refrigerants and thorough leak-checking in line with F-Gas requirements.

They also support scheduled preventative-maintenance visits to customers' sites, where engineers carry out further leak checks and, where necessary, replace refrigerant gases with modern drop-in alternatives that significantly reduce potential global-warming impact in the event of a leak.

Additionally, the surcharge contributes to the certified, compliant disposal of waste refrigerants, compressor oils, and glycol returned from water-chiller hires.

Without these measures, the company would not be able to maintain legally compliant, environmentally responsible operations or continue providing reliable and efficient temperature-controlled equipment.
